[1960] 8p. (8 figs. 2 refs. omitted).
Order from SLA ml\$1.80, ph\$1.80

61-10567

Trans. of Draht (West Germany) 1960, v. 11, no. 1,
p. 1-4.

An electromatically controlled device is described by means of which lacquered wire specimens may be dipped under reproducible conditions. The period of dipping may be indicated as to fractions of seconds. Temperature of solution is stabilized by means of a hoop-droop regulator. The device was used to prove that the dipping times depend not only on the diameter of the bare wire but also on the chemical composition of the lacquer film and its degree of baking. In addition, by inserting brief dipping periods it was possible to determine the decomposition rate of the film as a function of the temperature of solution follows the Arrhenius equation. (Materials--Finishes, TT, v. 5, np. 7)
